1 General information

This operating manual is for handling pressure regulators. Operating errors can be prevented only with knowledge of this operating manual.

Operating personnel must be informed about the contents of this operating manual.

Improper use may result in hazard to life for the user or other third parties and/or damage to other material assets.

We reserve the right to make technical modifications for improvement purposes to the comparisons and information in this operating manual.

2 Warranty provisions

There shall be no liability, or the warranty shall be void under the following conditions:

- The information and instructions of the operating manual are not followed.
- The devices are improperly used.
- The devices are used for purposes other than their intended one.
- Any type of functional changes were conducted without the written permission of ZIMMERLI MESSTECHNIK AG.
- Disregard of the applicable safety regulations when operating the device.
- Guards were not used or functionality was disabled.

Only approved, original spare parts must be used when replacing parts and/or for procuring spare parts.

3 Purpose

These type of pressure regulators are suitable for various tasks (e.g. inerting containers with inactive gases). The degree of protection for the standard design is IP40 and IP54 with weather protection.

The exact design is customized and must therefore be taken from the device's technical information.

3.1 Intended use

Ambient temperature:	-20 °C up to +40 °C
Ambient pressure:	0.8 to 1.1 bar
Medium pressure:	Permissible PN, maximum p ₁ , maximum p ₂ according to the data sheet
Medium temperature:	According to sealing material, see data sheet
Degree of protection:	IP40, IP54 with weather protection

Limitations of the medium: No combustible gases in an explosive concentration. Exception, ATEX-certified devices according to:

- II 2 G Ex h IIB T6 Gb
- II 3 G Ex h IIC T6 Gc
- II 2 D Ex h IIIC T6 Db
- II 3 D Ex h IIIC T6 Dc

External radiation (electromagnetic, ionizing radiation, ultrasound): none (if such radiation is present in the area used, the hazard must be taken into account and assessed by the user.) Keep the devices free of dust (dust thickness smaller than 1 mm).

3.2 Assembly work on the pressure regulator

The user and operator must take measures for mounting, disassembly, and maintenance work of and on the pressure regulator in areas with explosive atmospheres to prevent these operations from creating sources of ignition.

4 Safety provisions

Any work on or with the device may be performed only by qualified personnel who are familiar with the applicable regulations on operating pressure regulators and/or pressure containers.

If disassembling safety equipment is required for installation, it must be assembled and inspected immediately once the work has concluded.

Do not exceed the operating pressure. It is specified on the nameplate of each device.

When using the device, the provisions regarding the filling material must be followed.

Natural regulations regarding usage and test intervals must be followed.

5 Material resistance

Since the operator chose the material, the supplier cannot provide any guarantees regarding material resistance. It is the operator's responsibility to ensure that the material of the devices, including seals and add-on components (e.g., pressure gauges, pilot regulator, etc.) are adequately resistant against the medium.

6 Startup

6.1 Before installation

Before installation, perform a visual inspection on the device to determine any transport damage. The device's performance data must be reviewed (max. inlet pressure, secondary pressure, etc.).

The values noted on the nameplate are the values measured in our functional test.

The resistance of the materials has to be checked (see the corresponding chapter of this operating manual).

Newly installed pipelines must be fully rinsed clean to eliminate mechanical residues. It must be ensured that the pressure regulator is connected at the local equipotential bonding, either through an adequate and permanent connection to metallic pipes or via a direct connection to local equipotential bonding.

6.2 Installation

Always install the low pressure regulator as close as possible to the process tank or consumer within non-turbulent flow.

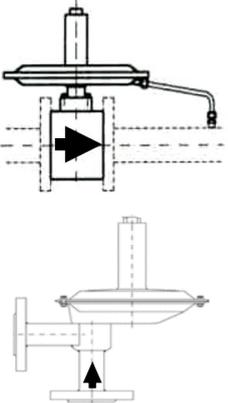

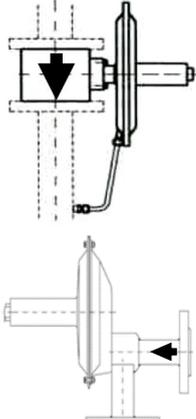

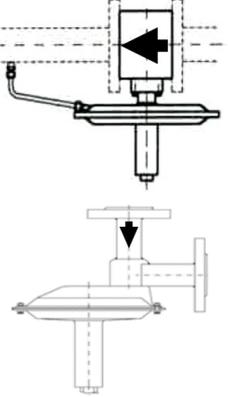

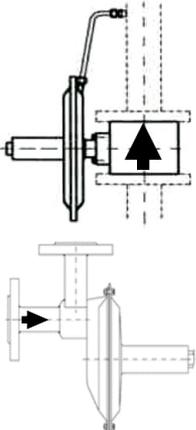

Be mindful of the flow direction! (Marked on the housing with an arrow). Otherwise, there is the risk of damaging the pressure regulator.

6.3 Assembly position and installation

Take note of the diaphragm installation position! (Horizontal diaphragm or vertical diaphragm). Sealed devices are set to the desired pressure according to the ordered position. If the devices are configured by the user, then this also must take place in the subsequent installation position.

The preferred mounting position and/or position of the diaphragm is as follows according to device type:

- ZM-R15, 25: Horizontal diaphragm housing (vertical: alternatively permissible).
 Assembly with the spring dome facing down is permissible only upon consultation.
- LPR25: Vertical diaphragm housing (horizontal: alternatively permissible).
 Assembly with the spring dome facing down is permissible only upon consultation

Horizontal		Mounting position (diaphragm)		Vertical	
	Recommended mounting position		Recommended mounting position		
	Spring dome on bottom side, only on request / dry gases		Only with option /E, (depending on the medium)		

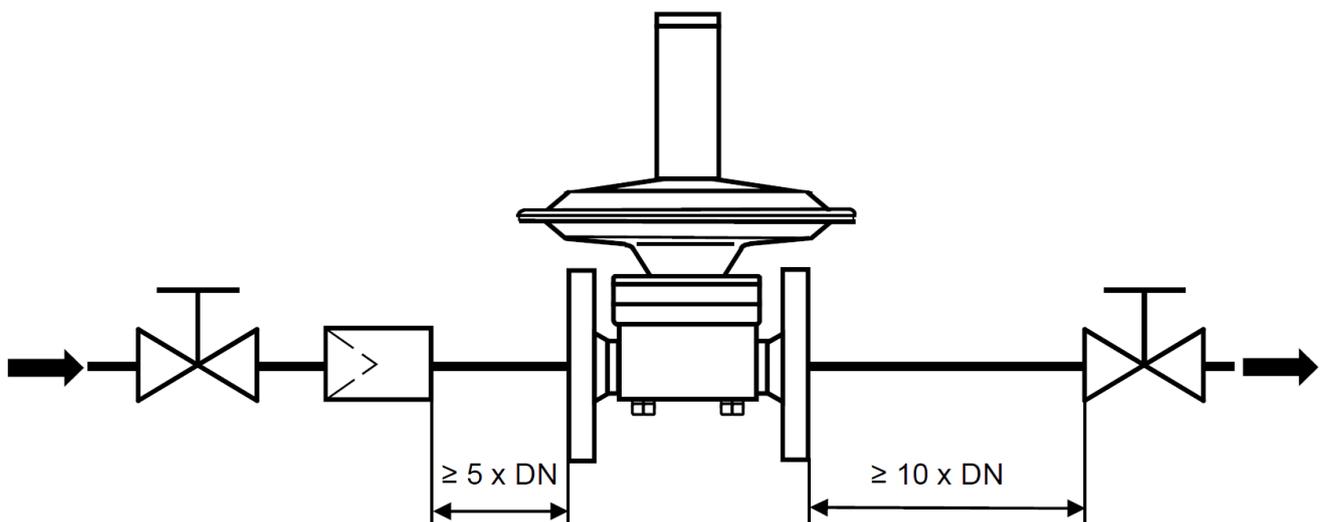

Important: The setpoint depends on the diaphragm position and must be adjusted according to the assembly position.

The configuration can be sealed using the lateral hole in the setting screw. Factory-sealed devices are set to the specified pressure.

Assembly must be performed on both sides (p_1 , primary side and p_2 , secondary side) within non-turbulent flow. To that end:

- Straight inlet piping of 5 x DN on the primary side and
- Straight outlet piping of 10 x DN on the secondary side is recommended

Furthermore, it is recommended that you install one shut-off valve each before and after the pressure regulator to simplify any maintenance work. Furthermore, a suitable filter must be installed before the pressure regulator in case of dirty gases or if there is a hazard of solid particles.

Avoid pressure shocks after assembly and always open shut-off valves slowly!

6.4 Configuring the setpoint

Always open the valves in lines before or after the pressure regulator slowly and avoid pressure shocks!

Spring-loaded model ZM-R und LPR:

Slowly open the valve or ball valve before or after the pressure regulator and set it to a small flow of approx. 1 to 2 Nm³/h.

Set the desired pressure by turning the setting screw (6 mm hexagon socket).

Warning! Observe the maximum values on the nameplate.

Clockwise rotation = Decreasing secondary pressure p_2

Counterclockwise rotation = Increasing secondary pressure p_2

Dome-loaded model (ZM-R/D and LPR/D):

With an additional pilot controller, the dome pressure can be set to the desired value. Up to 1000 mbar and/or 2000 mbar of dome pressure is permissible depending on the device type. Precise adjustments can also be made via the setting screw on the spring dome.

7 Impulse line (C-connection)

An impulse line must be able to communicate with the p_1 side of the valve under any circumstances. Accordingly, no valves or other flow resistances may be present in the secondary, non-turbulent flow area between the device and impulse line pickup. Otherwise, the device is not functional and may even be destroyed.

If the impulse line is not connected, there is also a risk of damaging or destroying the devices, depending on the inlet pressure.

For **ZM-R15**, **ZM-R25** device types, an impulse line (G1/4 connection) is recommended if:

- $P_1 \geq 8$ bar at Kv 0.65
- $P_1 \geq 4$ bar at Kv 1.25
- Generally for Kv 2 and 2.5

Connection ≥ 300 mm from the center of the device (or directly at the process for longer lines)
An impulse line must not be tapped in a turbulent zone.

For **LPR**, the impulse line is optional and is not required for standard applications.

8 Maintenance and repairs

The previously mentioned pressure regulators work without auxiliary energy and are maintenance-free. Additional queries may be processed only by specifying the serial number.

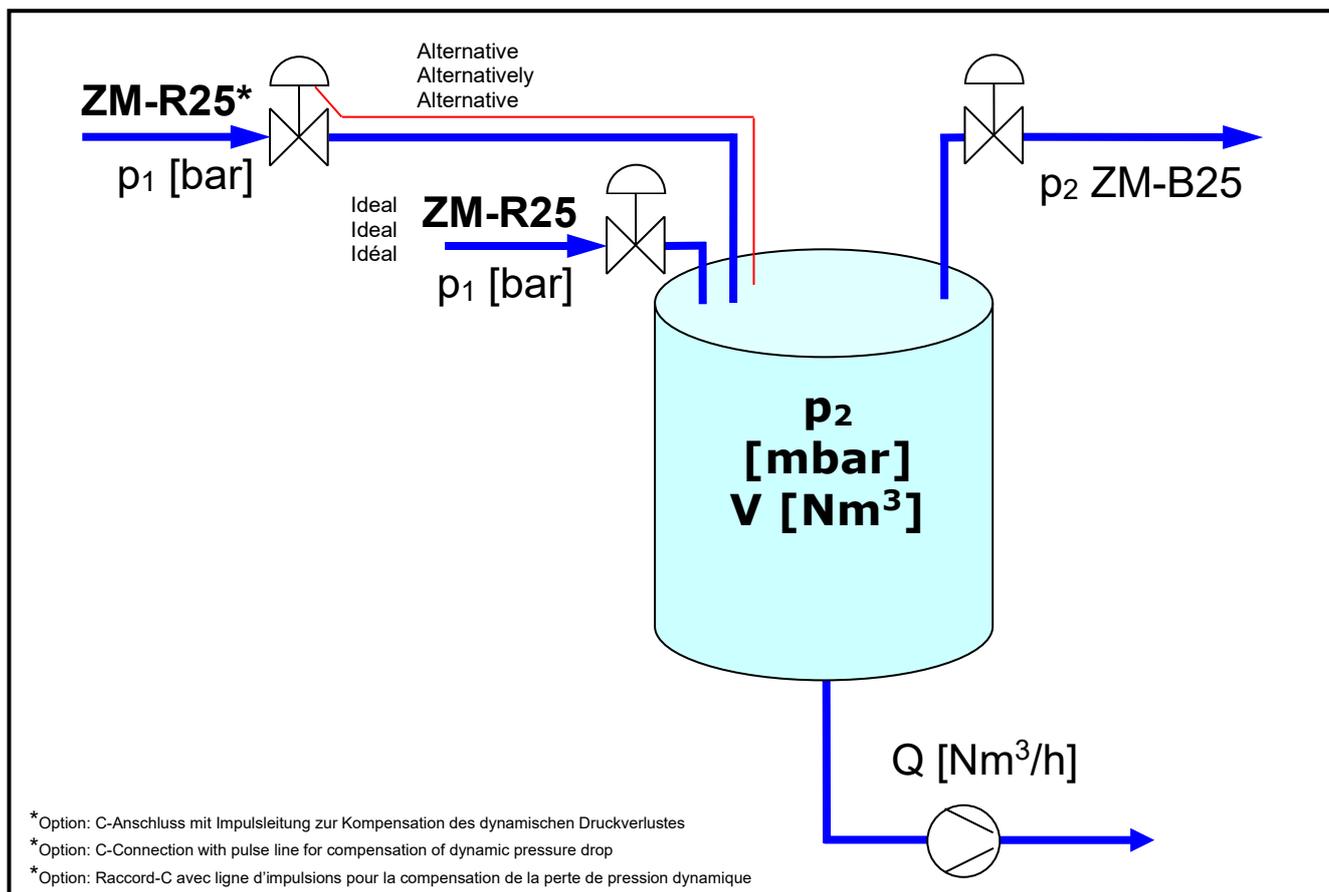

The serial number must be specified for spare part orders.

Device returns for repair or modification can be accepted only if they have been cleaned and have a completed RMA according to the applicable regulations. In the case of hazardous media, we recommend returning the device disassembled and cleaned.

8.1 Inspection intervals

An annual review of the function or maintenance is recommended depending on the characteristics of the medium and the respective operating states. Depending on these results, the testing/maintenance interval can be shortened or extended by the operator/user.

9 Model selection

Anwendungsdaten

Zur optimalen Auslegung eines Niederdruck Reduzierventil ZM-R25 sind mindestens folgende Angaben wichtig:

Behälter Entleergradient

Entleerungsgradient, bzw. Pumpenleistung wie folgt:

$$Q = \quad \text{Nm}^3/\text{h}$$

$$V = \quad \text{Nm}^3$$

Inertgas

Der optimale Vordruck liegt bei 2 bar g (max. 10 bar g).

$$p_1 = \quad \text{bar g}$$

$$p_2 = \quad \text{mbar g}$$

Werkstoff

Welcher Werkstoff ist ausreichend chemisch beständig?

- Edelstahl
- Hastelloy C
- Kunststoff (auf Anfrage)

Betriebsart

- Standard / Überdruck
- Negativdruck / Unterdruck
- Domgesteuert

Montage*

- Direkt auf Tank, vertikal
- Direkt an Tank, horizontal
- Innerhalb von Gebäuden
- Im Freien mit Schutzhaube
- In Rohrleitung mit C-Anschluss* und separater Impulsleitung zum Prozess

Application data

For correct model selection of ZM-R25 low pressure reducing valve, the following specifications are essential:

Tank empty rate

Tank empty rate or pump volume as follows:

$$Q = \quad \text{Nm}^3/\text{h}$$

$$V = \quad \text{Nm}^3$$

Inert gas

Ideal primary pressure is about 2 bar g (max. 10 bar g).

$$p_1 = \quad \text{bar g}$$

$$p_2 = \quad \text{mbar g}$$

Material of construction

What material of construction is durable enough?

- SST
- Hastelloy C
- plastic (on request)

Mode

- Gauge Pressure Blanketing, Standard
- Negative pressure service
- Dome loaded service

Installation*

- Top mounted on tank, vertical
- Side mounted at tank, horizontal
- In door
- Out door with weather protection
- In pipe with C-Connection* and pulse line to process

Données de l'application

Les renseignements suivants représentent un minimum nécessaire pour effectuer le dimensionnement optimal d'un ZM-R25.

Gradient de vidange du réservoir

Gradient de vidange, resp. puissance de la pompe comme suit:

$$Q = \quad \text{Nm}^3/\text{h}$$

$$V = \quad \text{Nm}^3$$

Gaz inerte

La pression primaire se situe à 2 bar g (max. 10 bar g).

$$p_1 = \quad \text{bar g}$$

$$p_2 = \quad \text{mbar g}$$

Matériaux de construction

Quel matériaux est suffisamment chimico-résistant ?

- Acier inoxydable
- Hastelloy C
- Matière plastique (nous consulter)

Mode de fonctionnement

- Pression relative, Standard
- Conditions en dépression
- Piloté par le dôme

Montage*

- Direct sur cuve, vertical
- Direct sur cuve, horizontal
- Locaux dans un bâtiment
- En extérieur avec protection
- Conduite avec raccord-C* et prise d'impulsion par rapport au procédé
